# Math H113 - Spring 2014 Notes

#### April 8, 2014

#### Introduction

This is a sparse collection of facts taken from Dummit and Foote, 3e. The goal is to recap the most important things Prof. Vojta has covered, with an emphasis on non-obvious results.

### Chapter 0/1

- 1. gcd: (m, n) = am + bn.
- 2. The Euler function:  $\varphi(p^a) = p^{a-1}(p-1), \ \varphi(ab) = \varphi(a)\varphi(b) \ \text{if } (a,b) = 1.$
- 3. The dihedral group:  $D_{2n} = \langle r, s \mid r^n = s^2 = 1, rs = sr^{-1} \rangle$ .
- 4. Fields  $(F, F^{\times} = F \{0\})$ : (F, +) and  $(F^{\times}, \times)$  are abelian groups. Note: if  $|F| < \infty$ ,  $\exists p, m \text{ s.t } |F| = p^m$ .
- 5. Symmetries:  $|S_n| = n!$ . Disjoint cycles commute, but  $S_{n\geq 3}$  is non-abelian.
- 6. Group actions on A by G: (i)  $g_1(g_2a) = (g_1g_2)a$ , (ii) 1a = a.  $\forall g_1, g_2, a$ .
  - (a) Fixing  $g \in G$  in the action gives  $\sigma_g \in S_A$ .
  - (b)  $g \mapsto \sigma_g$  is a homomorphism  $(G \to S_A)$ , the permutation representation).

- 1. Subgroup criterion:  $H \neq \phi$  and  $xy^{-1} \in H \ \forall x, y \in H$ .
- 2. Centralizer:  $\leq G$ , commutes with A. Center:  $\leq G$ , commutes with G itself.
- 3. Normalizer:  $\leq G$  s.t  $gAg^{-1} = A \ \forall g$ .
- 4. Stabilizer: fixing  $a \in A, \leq G$  s.t ga = a. Kernel:  $\forall a \in A, \leq G$  s.t ga = a.
- 5. If  $x^m = 1$  and  $x^n = 1$ ,  $x^{(m,n)} = 1$  (in cyclic groups).

- 6. Let  $x \in G$ ,  $a \neq 0$ : if  $|x| = \infty$  then  $|x^a| = \infty$ . Else, if |x| = n, then  $|x^a| = n/(n, a)$  (\*).
- 7. Every subgroup of a cyclic group is cyclic, and cyclic groups of the same order are isomorphic to each other.
- 8. Let |x| = n,  $H = \langle x \rangle$ . Only if (n, a) = 1,  $H = \langle x^a \rangle$  (count these with  $\varphi(n)$ ). A general statement:  $\langle x^m \rangle = \langle x^{(n,m)} \rangle$ .
- 9. Let  $A \neq \phi$  be a set of subgroups of G. Then their intersection  $\langle A \rangle = \cap A \leq G$ .

- 1. Given  $\varphi: G \to H$ ;  $\varphi(1_G) = 1_H$ ,  $\ker \varphi \leq G$ , and  $\operatorname{im}(\varphi) \varphi \leq H$ .
- 2. G/K is basically arithmetic on the fibers of  $\varphi$ , which are all cosets of ker  $\varphi$ .
- 3. The set of left cosets of any  $N \leq G$  partitions G. However, the operation  $uN \cdot vN = (uv)N$  is only well defined if  $N \leq G$  (or equivalently  $N_G(N) = G$ ,  $gN = Ng \ \forall g$ , or  $gNg^{-1} \subseteq N \ \forall g$ ).
- 4. If  $|G| < \infty$  and  $H \le G$ , then  $|H| \mid |G|$  and |G:H| = |G|/|H| (\*).
- 5. If  $|G| < \infty$  and  $p \mid |G|$ ,  $\exists x \in G$  s.t |x| = p.
- 6. If  $|G| = p^{\alpha} m \ (p \ / m), \exists H \leq G \text{ s.t } |H| = p^{\alpha}$ .
- 7.  $\ker \varphi \leq G$ ,  $G/\ker \varphi \cong \varphi(G)$ ,  $\varphi$  is 1-1 iff  $\ker \varphi = 1$ , and  $|G:\ker \varphi| = |\varphi(G)|$ .
- 8. If finite  $H, K \leq G$ , then  $|HK| = \frac{|H||K|}{|H \cap K|}$ .  $HK \leq G$  only if  $KH \leq G$ .
- 9. Let  $A, B \leq G$  and  $A \leq N_G(B)$ . Then  $AB \leq G$ ,  $B \subseteq AB$ ,  $A \cap B \subseteq A$ , and  $AB/B \cong A/(A \cap B)$ .
- 10. Let  $H \leq K$  and  $H, K \leq G$ : then  $K/H \leq G/H$  so  $(G/H)/(K/H) \cong G/K$ .
- 11. For  $N \leq G$ , there is a bijection between subgroups of G containing N and subgroups of G/N
- 12. To show that a homomorphism from  $\varphi: G/N \to H$  is well-defined, one must prove  $N \leq \ker \Phi$  (with  $\Phi: G \to H$ ).
- 13.  $(a_1a_2...a_m) = (a_1a_m)(a_1a_{m-1})...(a_1a_2)$ . The sign of a permutation (i.e the parity of the number of 2-cycles  $\epsilon(\sigma) \in \{\pm 1\}^2$ ) is representation-independent.
- 14.  $\epsilon: S_n \to \{\pm 1\}$  is a surjective homomorphism.  $\ker \epsilon = A_n$ , the group of even permutations. Note  $S_n/A_n \cong \epsilon(S_n) = \{\pm 1\}$  and  $|A_n| = \frac{n!}{2}$ .

 $<sup>^1{\</sup>rm A}$  useful theorem for later: gH=H iff  $g\in H.$ 

<sup>&</sup>lt;sup>2</sup>An *m*-cycle is composed of m-1 transpositions, immediately giving  $\epsilon(\sigma) = Parity(m-1)$ .

- 15. For  $H \leq G$  and |G:H| = p prime, then for all  $K \leq G$ , either  $K \leq H$  or  $(G = HK \text{ and } |K:K \cap H| = p)$
- 16. The commutator subgroup  $N = \langle x^{-1}y^{-1}xy|x,y \in G \rangle$  is normal, and G/N is always abelian.
- 17. ' $\leq$ ' is **not** transitive, i.e  $A \subseteq B \land B \subseteq C \not\Rightarrow A \subseteq C$ .
- 18. In general,  $H \times (G/H) \ncong G$ .

### Chapter 4

- 1.  $\sigma_g: A \to A \ (a \mapsto ga)$ , and  $\varphi: G \to S_A \ (g \mapsto \sigma_g)$ . Note: the kernel of the action  $\cap_{a \in A} G_a = \ker \varphi$ .
- 2. For  $A \neq \phi$ , each action  $G \times A \to A$  is isomorphic to a homomorphism  $G \to S_A$ . Let  $a \sim b$  iff a = gb for some  $g \in G$ : then  $\sim$  partitions G, and the order of the equivalence class (i.e orbit) containing a is  $|G:G_a|$ .
- 3. Elements in G effect the same permutation on A iff they're in the same coset of the kernel of the action.
- 4. Let  $H \leq G$ , A be the set of left cosets of H in G, and G act on A (with  $\pi_H : G \to S_A$ ). Then the action is transitive,  $G_{1H} = H$ , and  $\ker \pi_H = \bigcap_{x \in G} xHx^{-1}$  (giving the largest normal subgroup of G in H).
- 5. If |G| = n,  $G \cong H$  for some  $H \leq S_n$ . If p is the smallest prime s.t p|n, then any subgroup  $H \leq G$  s.t |G:H| = p is normal.

- 1. Given a direct product  $G_1 \times G_2 \times ... \times G_n$ ,  $G_i \cong \{(1,...,g_i,...,1) \mid g_i \in G_i\}$ .
- 2. Let  $G = \langle A \rangle$  ( $A \subseteq G$ , finite). Then  $G \cong \mathbb{Z}^r \times Z_{n_1} \times Z_{n_2} \times ... \times Z_{n_s}$  s.t  $r \ge 0$ ,  $n_i \ge 2 \ \forall j$ , and  $n_{i+1} | n_i$  for  $1 \le i < s$  uniquely (up to isomorphism).
- 3. Let  $n = \prod n_i$ : if p|n then  $p|n_1$ . If n is a product of distinct primes, then  $Z_n$  is the only abelian group of order n (up to isomorphism).
- 4. Let  $n=p_1^{\alpha_1}...p_k^{\alpha_k}$ . Then  $G\cong A_1\times...\times A_k$  where  $|A_i|=p_i^{\alpha_i}$ . Each  $A_i\cong Z_{p_i^{\beta_1}}\times...\times Z_{p_i^{\beta_t}}$  where  $\beta_i\geq \beta_{i+1}$  and  $\sum_i^t\beta_i=\alpha_i$ .
- 5.  $Z_m \times Z_n \cong Z_{mn}$  iff (m,n) = 1, so  $Z_n \cong Z_{p_1^{\alpha_1}} \times ... \times Z_{p_r^{\alpha_k}}$ .
- 6. The group exponent is the smallest positive integer s.t  $x^n = 1 \ \forall x \in G$ .

 $<sup>^3\</sup>mbox{`Faithful'}$  actions have kernels equal to  $\{1_G\}$ 

 $<sup>^{4}</sup>$  Transitive' actions induce only one orbit in A.

<sup>&</sup>lt;sup>5</sup>The projection  $\pi: G \to G_i$  is  $g \mapsto g[i]$ .

7. The elementary abelian group of order  $p^n$ :  $E_{p^n} = (Z_p)^n$ . Each non-identity element has order p, and there are p+1 subgroups of order p in  $E_{p^2}$ .

#### Chapter 6

- 1. Let F(S) be the group of words formed from S. Given a map  $\psi: S \to G$ , there exists a unique homomorphism  $\Phi: F(S) \to G$  s.t  $\Phi|_S = \psi$ .
- 2. Because  $\Phi$  is a homomorphism,  $\Phi(s_i^{\epsilon_i}...) = \psi(s_i)^{\epsilon_i}...$
- 3. Empty word: (1,1,...). Reduced word:  $s_{i+1} \neq s_i^{-1}$  and  $s_i = 1 \Rightarrow s_{k \geq i} = 1$ .
- 4. Subgroups of free groups are also free groups.
- 5. Let  $S \subseteq G$  s.t  $G = \langle S \rangle$ . A presentation of G is some (S, R) s.t ker  $\Phi$  is the smallest normal subgroup containing  $\langle R \rangle$ . G is finitely generated if S is finite, and finitely presented if R is also finite.
- 6. Any free abelian group of rank n is  $\cong \mathbb{Z}^n$

- 1. Rings: (R, +) is abelian,  $\times$  is associative/distributive. If  $\times$  commutes, so does R. If  $1 \in R$ ,  $1r = r1 \ \forall r$ . If  $1 \neq 0$  and every nonzero element has an inverse, R is a division ring. Commutative division rings are fields.
- 2. Let  $a, b \in R$  be nonzero. Then a0 = 0a = 0. Zero divisors: ab = 0 or ba = 0. The set of units (i.e uv = vu = 1) is  $R^{\times}$ .
- 3. Integral domains are commutative rings (with  $1 \neq 0$ ) with no zero divisors. Zero divisors cannot be units, therefore fields have no zero divisors.
- 4. Finite integral domains are fields. Subrings are  $\leq R$  and closed under  $\times$ .
- 5. R[x]:  $(ab)x^k = \sum_{i=0}^k a_i b_{k-i} = \sum_{i=0}^k a_{k-i} b_i$ . Note:  $R \subset R[x]$  (as the constant polynomials) and R[x] is commutative iff R is.
- 6. If R is an integral domain,  $\deg(ab) = \deg(a) + \deg(b)$ ,  $R[x]^{\times} = R^{\times}$ , and R[x] is an integral domain.
- 7. Square matrices:  $(a_{ij}) \in M_n(R)$ . Invertible:  $GL_n(R)$ .
- 8. Fix a commutative ring R with  $1 \neq 0$  and let G be a finite group. Group rings RG contain all formal sums  $\sum_i r_i g_i \ r_i \in R$ . Addition is done componentwise, and RG always has zero divisors.
- 9. Ring homomorphism:  $\varphi: R \to S$  s.t  $\varphi(a+b) = \varphi(a) + \varphi(b)$  and  $\varphi(ab) = \varphi(a)\varphi(b)$ .  $\ker \varphi = \{r \in R \mid \varphi(r) = 0_S\}$ , as if  $\varphi$  were a group homomorphism.

- 10.  $I = \ker \varphi$  is a subring of R (and an ideal/normal subgroup thereof),  $\operatorname{im}(\varphi)$  is a subring of S. If  $\alpha \in \ker \varphi$ , then  $r\alpha$ ,  $\alpha r \in R \ \forall r \in R$ .
- 11. Ideals: if  $rI \subseteq I$ ,  $Ir \subseteq I$ , and I subring of R. R/I is a quotient ring s.t (r+I)+(s+I)=(r+s)+I and  $(r+I)\times(s+I)=rs+I$ .  $R/\ker\varphi\cong\varphi(R)$ . Note: every ideal is the kernel of a ring homomorphism and vice versa.
- 12. Let A be a subring and B an ideal of R. Then A+B is a subring of R,  $A\cap B$  is an ideal of A, and  $(A+B)/B\cong A/(A\cap B)$ .
- 13. Let  $I \subseteq J$  be ideals of R, then  $(R/I)/(J/I) \cong R/J$ .
- 14. For ideals I of R, there is a bijection between subrings of R containing I and subrings of R/I.
- 15. Ideal math:  $I + J = \{i + j \mid i \in I, j \in J\}$ , IJ is the set of all finite sums of elements of the form ij, and  $I^n$  are all n-length products within I.
- 16. I + J is the smallest ideal containing I and J, and  $IJ \subseteq I \cap J$ .
- 17. If R is a commutative ring with a 1, and I+J=R, then  $IJ=I\cap J$ .
